**FEDS TO FUND EMBRYO MIX OF HUMAN, ANIMAL CELLS**  
**SCIENTISTS SEE HOPE WITH "CHIMERA"**

- The Federal Government is planning to lift a moratorium on funding for research studying the effects of injecting animal embryos with human stem cells, creating Half-Human Half-Animal Hybrids.
- Injecting human stem cells into animal embryos holds the potential to grow human organs in the animals capable of being transplanted into sick patients.
- Such experimentation raises difficult ethical questions, such as how to treat potentially partially human species.
- It blurs the line between humans and other species and asks the questions exactly what are these creatures and how do we treat them?
- Chimera experiments could run the risk of changing the brains of the animals, which researchers worry could induce a human-like state of awareness.
- Experiments that could result in an animal sperm and human egg to breed or vice versa would be prohibited. Also experiments on primate embryos because they are so similar to humans.
- The general public reportedly will have one month to comment on the proposed change before moratorium is lifted.

PLEASE DO NOT FUND OR PARTICIPATE  
IN "CHIMERA" RESEARCH.

THIS WILL TAKE AMERICA DOWN A  
VERY DARK ROAD!

RESPECTFULLY,

Rachel Leonard
